

MINNEDOSA ETHANOL PLANT

Husky Energy

Minnedosa, Manitoba

Project Description

In 2005, KGS Group were retained by Husky Energy, Calgary to carry out a detailed design and equipment procurement for a new 130 Million Litres per year motor grade ethanol plant in Minnedosa, Manitoba. Husky already owned and operated an existing 10 million litres per year plant at that site but determined that expansion of this facility would not be economically feasible. The new plant will include a new steam plant and cooling tower as well as grain receiving and storage and ethanol production facilities. In addition to ethanol, the plant will produce approx. 389,000 tonnes per year of Distillers Dried Grain with Solubles (DDGS). State of the art drying technology will be utilized on the project to control air emissions to environmentally acceptable standards.

KGS Group worked with Katzen International Inc, Cincinnati who provided state-of-the-art ethanol process technology to the team.

The project construction began in 4th quarter 2005 with completion of the \$140 million project scheduled for 1st quarter 2007.
